Quantum tools for Information-Theoretic security

- Information-Theoretic security

Quantum tools for Information-Theoretic security

- **Information-Theoretic security**
 - strongest notion of security, as it makes no assumptions on the attacker's computing power

Quantum tools for Information-Theoretic security

- **Information-Theoretic security**
 - strongest notion of security, as it makes no assumptions on the attacker's computing power
 - only relies on information theory

Quantum tools for Information-Theoretic security

- **Information-Theoretic security**
 - strongest notion of security, as it makes no assumptions on the attacker's computing power
 - only relies on information theory
- **Physical laws of Quantum Mechanics** can be exploited while looking for I-T security

Quantum tools for Information-Theoretic security

- **Information-Theoretic security**
 - strongest notion of security, as it makes no assumptions on the attacker's computing power
 - only relies on information theory
- **Physical laws of Quantum Mechanics** can be exploited while looking for I-T security
 - **Eavesdropping detection**

“In quantum systems, one cannot take a measurement without perturbing the system itself.”

Quantum tools for Information-Theoretic security

- **Information-Theoretic security**
 - strongest notion of security, as it makes no assumptions on the attacker's computing power
 - only relies on information theory
- **Physical laws of Quantum Mechanics** can be exploited while looking for I-T security
 - **Eavesdropping detection**

“In quantum systems, one cannot take a measurement without perturbing the system itself.”

 - passive attacks can be detected

Quantum tools for Information-Theoretic security

- **Information-Theoretic security**

- strongest notion of security, as it makes no assumptions on the attacker's computing power
- only relies on information theory

- **Physical laws of Quantum Mechanics** can be exploited while looking for I-T security

- **Eavesdropping detection**

“In quantum systems, one cannot take a measurement without perturbing the system itself.”

- passive attacks can be detected
- no perturbation \Rightarrow no measurement \Rightarrow no eavesdropping

Quantum tools for Information-Theoretic security

● Information-Theoretic security

- strongest notion of security, as it makes no assumptions on the attacker's computing power
- only relies on information theory

● Physical laws of Quantum Mechanics can be exploited while looking for I-T security

① Eavesdropping detection

“In quantum systems, one cannot take a measurement without perturbing the system itself.”

- passive attacks can be detected
- no perturbation \Rightarrow no measurement \Rightarrow no eavesdropping

② No-cloning theorem

“Perfect copying is impossible in the quantum domain.”

Quantum tools for Information-Theoretic security

● Information-Theoretic security

- strongest notion of security, as it makes no assumptions on the attacker's computing power
- only relies on information theory

● Physical laws of Quantum Mechanics can be exploited while looking for I-T security

① Eavesdropping detection

“In quantum systems, one cannot take a measurement without perturbing the system itself.”

- passive attacks can be detected
- no perturbation \Rightarrow no measurement \Rightarrow no eavesdropping

② No-cloning theorem

“Perfect copying is impossible in the quantum domain.”

- replay and man-in-the-middle attacks are more difficult to deploy

Quantum Key Distribution

- Eavesdropping detection + no-cloning theorem
 - do not provide a complete solution for all cryptographic purposes, but offer an advantage over classical systems
 - they allow to know a posteriori if the information sent over a quantum channel and shared by two parties is actually secret

Quantum Key Distribution

- Eavesdropping detection + no-cloning theorem
 - do not provide a complete solution for all cryptographic purposes, but offer an advantage over classical systems
 - they allow to know a posteriori if the information sent over a quantum channel and shared by two parties is actually secret
- What if we use these tools in order to deploy a secret key agreement protocol?

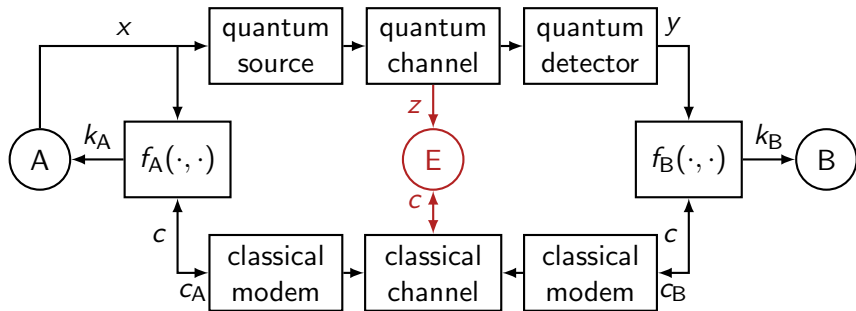

Quantum Key Distribution
(QKD)

Outline

- 1 Motivations
- 2 QKD system model
- 3 Key distillation
- 4 QKD in practice

QKD system model

Channel characteristics

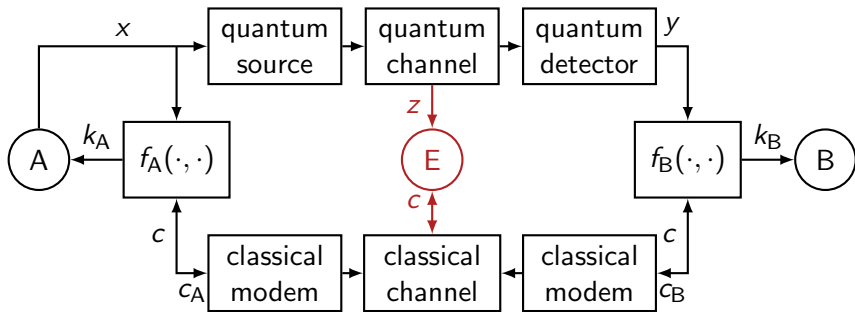

| Quantum Ch. | Classical Ch. |
|-------------|---------------|
| private | public, auth. |
| low rate | high rate |
| unreliable | reliable |

Objectives

$$\max_{f_A, f_B, X} H(k_A) \quad \text{subject to:}$$

- **(Correctness)** $P[k_A \neq k_B] < \epsilon$
- **(Secrecy)** $I(k_A, k_B; z, c) < \epsilon'$
- **(Uniformity)** $L(K_A) - H(K_A) < \epsilon''$

QKD system model

Legend

| | |
|------------------|---------------------------------------|
| x/y | prepared/measured random bit sequence |
| z | information on x leaked to E |
| $c = [c_A, c_B]$ | public communications |
| f_A, f_B | key distillation functions |
| k_A, k_B | final keys |

Key distillation: a practical scheme

3-phase protocol [Maurer,1993]:

Key distillation: a practical scheme

3-phase protocol [Maurer,1993]:

- Sifting → advantage over E

so that $I(x'; y') > I(x'; z, c')$

Key distillation: a practical scheme

3-phase protocol [Maurer,1993]:

- 1 Sifting → advantage over E

$$\text{so that } I(x'; y') > I(x'; z, c')$$

- 2 Information reconciliation → correctness

$$\text{so that } P[x'' \neq y''] < \varepsilon'$$

Key distillation: a practical scheme

3-phase protocol [Maurer,1993]:

SIFTING - keep $(x_i, y_i) \iff \psi_i = \xi_i$

Key reconciliation

Channel characteristics

| Quantum Ch. | Classical Ch. |
|-------------|---------------|
| private | public, auth. |
| low rate | high rate |
| unreliable | reliable |

Objectives

- 1 **Correctness:** $P[x' = \hat{x}'] \approx 1$
- 2 **Secrecy:** $I(x'; c) < \delta$

Key reconciliation

① Interactive

- Keys are interactively reconciled by means of a binary error search based on multiple, subsequent public communications [Brassard-Salvail,93].

Key reconciliation

1 Interactive

- Keys are interactively reconciled by means of a binary error search based on multiple, subsequent public communications [Brassard-Salvail,93].

2 Systematic

- Given a $(n + r, n)$ generating matrix $\mathbf{G} = \begin{bmatrix} \mathbf{I}_n \\ \mathbf{A} \end{bmatrix}$:
 - 1 Alice transmits the redundancy $\mathbf{c} = \mathbf{A}\mathbf{x}'$
 - 2 Bob chooses $\hat{\mathbf{x}}' = \arg \min_{\mathbf{a} \in \mathcal{C}} d(\mathbf{a}, [\mathbf{y}, \mathbf{c}])$
- Examples: LDPC [Mondin et al.,2010]
BCH [Traisilanun et al.,2007]

Key reconciliation

1 Interactive

- Keys are interactively reconciled by means of a binary error search based on multiple, subsequent public communications [Brassard-Salvail,93].

2 Systematic

- Given a $(n + r, n)$ generating matrix $\mathbf{G} = \begin{bmatrix} \mathbf{I}_n \\ \mathbf{A} \end{bmatrix}$:
 - 1 Alice transmits the redundancy $\mathbf{c} = \mathbf{A}\mathbf{x}'$
 - 2 Bob chooses $\hat{\mathbf{x}}' = \arg \min_{\mathbf{a} \in \mathcal{C}} d(\mathbf{a}, [\mathbf{y}, \mathbf{c}])$
- Examples: LDPC [Mondin et al.,2010]
BCH [Traisilanun et al.,2007]

3 Hashing

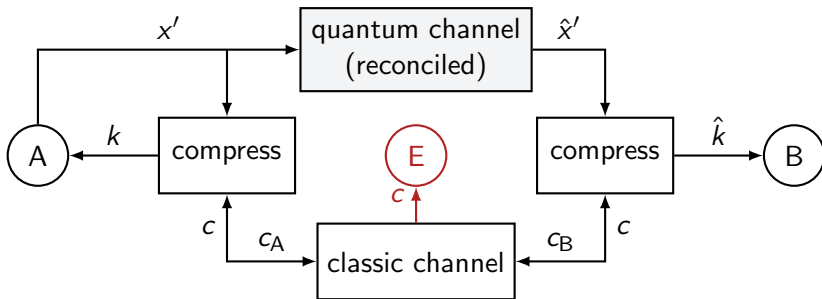

- Given a $(n, n - r)$ parity check matrix \mathbf{H} :
 - 1 Alice transmits the syndrome $\mathbf{c} = \mathbf{H}\mathbf{x}'$
 - 2 Bob chooses $\hat{\mathbf{x}}' = \arg \min_{\mathbf{a}: \mathbf{H}\mathbf{a}=\mathbf{c}} d(\mathbf{a}, \mathbf{y})$
- Examples: Winnow [Buttler et al.,2003]
LDPC [Elkouss et al.,2009]

Key reconciliation

The choice of the coding technique for reconciliation depends on the model for the classical channel

| Layer | Ch. type | Condition | Delays | Codes used |
|-----------|----------|------------|--------|----------------------|
| Physical | AWGN | high SNR | none | systematic (soft) |
| Data link | binary | low BER | low | systematic (hard) |
| Net & up | packet | error free | long | interactive, hashing |

Privacy amplification

| Channel characteristics | |
|-------------------------|---------------|
| Quantum Ch. | Classical Ch. |
| private | public, auth. |
| low rate | high rate |

- Goals
- 1 Maximum privacy: $I(\mathbf{k}; \mathbf{z}, \mathbf{c}) < \epsilon''$
 - 2 Minimum compression: $\max H(\mathbf{k})$

Choosing a compression function

Definition (2-universal hash functions [Wegman-Carter, 1979])

A class \mathcal{H} of hash functions from $\{0, 1\}^n$ to $\{0, 1\}^m$ is 2-universal if

$$\forall x, y \in \{0, 1\}^n, x \neq y, \quad h \in \mathcal{H} : P[h(x) = h(y)] \leq \frac{1}{2^m}$$

$$|\{h \in \mathcal{H} : h(x) = h(y)\}| \leq \frac{1}{2^m} |\mathcal{H}|$$

Choosing a compression function

- $n = H(x')$
- $t = I(x'; z, c)$
- $s = \text{security margin}$

$$\Rightarrow r = H(k) = n - t - s$$

Theorem ([Bennett et al., 1995])

If the compressing function h is chosen uniformly from a class of 2-UHFs, then on average (over z and h)

$$I(k; z, h) \leq \frac{2^{-s}}{\ln 2}$$

Choosing a compression function

- Families of 2-universal hash functions

- ...

- Random matrices

- ...

- Toeplitz random matrices**

Randomly choose an $(n + m - 1)$ -bit seed which defines a random $m \times n$ Toeplitz matrix

$$\begin{bmatrix} z_1 \\ \vdots \\ z_m \end{bmatrix} = \begin{bmatrix} s_4 & s_5 & \dots & \dots & \dots & \dots & s_{n+m-1} \\ s_3 & s_4 & \cdot & \cdot & \cdot & \cdot & s_{n+m-2} \\ s_2 & s_3 & \cdot & \cdot & \cdot & \cdot & \vdots \\ s_1 & s_2 & s_3 & s_4 & s_5 & \dots & s_{n-1} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}$$
