$\pi : M \rightarrow Y$  smooth  $\mathbb{P}^1$ -fibration.  $\Gamma$  fiber,  $K$  relative canonical

## Lemma

Let  $D$  be a divisor on  $M$  and set  $l := D \cdot \Gamma + 1$ . Then,  $\forall i \in \mathbb{Z}$

$$H^i(M, D) \cong H^{i-1}(M, D + lK) \quad \text{if } l < 0$$

$$H^i(M, D) \cong \{0\} \quad \text{if } l = 0$$

$$H^i(M, D) \cong H^{i+1}(M, D + lK) \quad \text{if } l > 0$$

In particular  $\chi(M, D) = -\chi(M, D + lK)$  for any  $D$ .

## Speculations

## Idea of Proof

Conclusion

Let's do the case

$$\begin{pmatrix} 2 & -1 \\ -3 & 2 \end{pmatrix}$$

Set  $L_2 = -2K_1 - K_2$ . Then  $L_2 \cdot \Gamma_2 = 0$ .So there exists  $H_2 \in \text{Pic}(X_2)$  such that  $L_2 = \pi_i^* H_2$ .

Let's do the case

$$\begin{pmatrix} 2 & -1 \\ -3 & 2 \end{pmatrix}$$

Set  $L_2 = -2K_1 - K_2$ . Then  $L_2 \cdot \Gamma_2 = 0$ .

So there exists  $H_2 \in \text{Pic}(X_2)$  such that  $L_2 = \pi_{2*} H_2$ .

We can write  $-\pi_1^* K_{X_2} = -K_X + K_2 = 5L_2 = 5\pi_1^* H_2$ .

Let's do the case

$$\begin{pmatrix} 2 & -1 \\ -3 & 2 \end{pmatrix}$$

Set  $L_2 = -2K_1 - K_2$ . Then  $L_2 \cdot \Gamma_2 = 0$ .

So there exists  $H_2 \in \text{Pic}(X_2)$  such that  $L_2 = \pi_i^* H_2$ .

We can write  $-\pi_1^* K_{X_2} = -K_X + K_2 = 5L_2 = 5\pi_1^* H_2$ .

So the index of  $X_2$ , which has dimension 5, is a multiple of 5; therefore the index is 5 and  $X_2 \simeq \mathbb{Q}^5$ .

Let's do the case

$$\begin{pmatrix} 2 & -1 \\ -3 & 2 \end{pmatrix}$$

Set  $L_2 = -2K_1 - K_2$ . Then  $L_2 \cdot \Gamma_2 = 0$ .

So there exists  $H_2 \in \text{Pic}(X_2)$  such that  $L_2 = \pi_{2*} H_2$ .

We can write  $-\pi_1^* K_{X_2} = -K_X + K_2 = 5L_2 = 5\pi_1^* H_2$ .

So the index of  $X_2$ , which has dimension 5, is a multiple of 5; therefore the index is 5 and  $X_2 \simeq \mathbb{Q}^5$ .

Set  $L_1 = -3K_1 - 2K_2$ . Then  $L_1 \cdot \Gamma_2 = 1$ , hence  $\pi_2$  is a projective bundle.

Let's do the case

$$\begin{pmatrix} 2 & -1 \\ -3 & 2 \end{pmatrix}$$

Set  $L_2 = -2K_1 - K_2$ . Then  $L_2 \cdot \Gamma_2 = 0$ .

So there exists  $H_2 \in \text{Pic}(X_2)$  such that  $L_2 = \pi_{2*} H_2$ .

We can write  $-\pi_1^* K_{X_2} = -K_X + K_2 = 5L_2 = 5\pi_1^* H_2$ .

So the index of  $X_2$ , which has dimension 5, is a multiple of 5; therefore the index is 5 and  $X_2 \simeq \mathbb{Q}^5$ .

Set  $L_1 = -3K_1 - 2K_2$ . Then  $L_1 \cdot \Gamma_2 = 1$ , hence  $\pi_2$  is a projective bundle.

The proof is finished by computing the Chern classes of the bundle.

The Cartan matrix of an FT-manifold with nef tangent bundle is the Cartan matrix of a semi simple Lie algebra.

Let  $X$  be an FT-manifold,  $I \subset \{1, \dots, n\}$  any nonempty subset, and let  $\pi_I : X \rightarrow X_I$  be the contraction of the corresponding face  $R_I$ .

Then every fiber of  $\pi_I$  is an FT-manifold whose Cartan matrix is the  $|I| \times |I|$  principal submatrix of  $M(X)$  obtained from  $M(X)$  by subtracting rows and columns corresponding to indices which are not in  $I$ .

## Speculations

In particular any  $2 \times 2$  principal submatrix is the Cartan matrix of an FT-manifold of Picard number 2. So

- $m_{ii} = 2$  for every  $i$ ,
- $m_{ij} = 0$  iff  $a_{ji} = 0$ ,
- if  $m_{ij} \neq 0$ ,  $i \neq j$ , then  $m_{ij}, m_{ji} \in \mathbb{Z}^-$  and  $m_{ij}m_{ji} = 1, 2$  or  $3$ .

This implies that  $M(X)$  is a generalized Cartan matrix (as in the theory of Kac-Moody algebras).

By induction we may assume  $M(X)$  is

- Of finite type (all the principal minors are positive definite) or
- Of affine type (all the proper principal minors are positive definite, but  $\det A = 0$ ).

### Theorem (OSWW 2014, OSWi 2015)

Let  $X$  be a smooth projective variety of Picard number  $n$ , such that there exist  $\Gamma_i \in N_1(X)$ ,  $i = 1, \dots, n$ , independent  $K_X$ -negative classes generating  $n$  extremal rays, whose associated elementary contractions  $\pi_i : X \rightarrow X_i$  are smooth  $\mathbb{P}^1$ -fibrations.

Then  $X$  is isomorphic to a flag manifold  $G/B$ , for some semisimple group  $G$ .
